Informe de Taller # 2

```
Wilson Andres Martinez Rivera 2266319
Juan David Camacho Cataño 2266292
Juan Gabriel Paredes Chaves 2266183
```

```
;;Expresiones condicionales
(expresion ("empty") list-empty-exp)

[expresion ("cons" "(" expresion expresion ")") list-cons-exp)
(expresion ("length" "(" expresion ")") list-length-exp)
(expresion ("first" "(" expresion ")") list-first-exp)
(expresion ("rest" "(" expresion ")") list-rest-exp)
(expresion ("nth" "(" expresion "," expresion ")") list-nth-exp)

;;Expresion Cond
(expresion ("cond" (arbno expresion "==>" expresion) "else" "==>" expresion "end") cond-exp)
```

Nueva implementación de la gramática de las listas con la variaciones de (empty), (cons), (length), (first), (rest), (nth), ademas se pone la expresion de Cond con el resplado de else.

```
(define-datatype lista lista?
 (lista-vacia)
 (lista-cons
  (primer-elemento number?)
  (resto-lista lista?)))
(define es-lista-vacia?
   (cases lista lst
     (lista-vacia () #t)
     (lista-cons (p r) #f))))
(define obtener-primer-elemento
   (cases lista 1st
      (lista-vacia () (eopl:error "No se puede obtener el primer elemento de una lista vacía"))
     (lista-cons (p r) p))))
(define obtener-resto
  (lambda (lst)
   (cases lista lst
     (lista-vacia () (eopl:error "No se puede obtener el resto de una lista vacía"))
     (lista-cons (p r) r))))
(define obtener-longitud
   (cases lista 1st
      (lista-vacia () 0)
      (lista-cons (p r) (+ 1 (obtener-longitud r))))))
```

Aquí está la implementación de la definición de las expresiones de las listas funciona de una manera individual.

```
;Evaluar expresion
define evaluar-expresion
(lambda (exp amb)
   (cases expresion exp
     (lit-exp (dato) dato)
     (var-exp (id) (apply-env amb id))
     (true-exp () #t)
     (false-exp () #f)
     (list-empty-exp () (lista-vacia))
     (list-cons-exp (elem lista)
       (let ([elem-evaluando (evaluar-expresion elem amb)]
             [lista-evaluada (evaluar-expresion lista amb)])
         (if (lista? lista-evaluada)
             (lista-cons elem-evaluando lista-evaluada)
             (eopl:error "El segundo argumento de cons no es una lista" lista-evaluada ))))
     (list-length-exp (lst)
       (let ([lista-evaluada (evaluar-expresion lst amb)])
         (obtener-longitud lista-evaluada)))
     (list-first-exp (lst)
       (let ([lista-evaluada (evaluar-expresion lst amb)])
         (obtener-primer-elemento lista-evaluada)))
     (list-rest-exp (lst)
       (let ([lista-evaluada (evaluar-expresion lst amb)])
         (obtener-resto lista-evaluada)))
```

Aquí se planteó la expresión en la cual se evalúa cada acción gramatical, nueva implementada por medio de las listas.

Estos fueron los únicos cambios que se hizo en el interpretador de asignación y se paso el interpretador de clase.

```
-->cons(1 cons(2 cons(3 empty)))
#(struct:lista-cons 1 #(struct:lista-cons 2 #(struct:lista-cons 3 #(struct:lista-vacia))))
-->empty
#(struct:lista-vacia)
-->cons(cons(1 empty) cons(2 empty))
lista-cons: bad value for primer-elemento field: #(struct:lista-cons 1 #(struct:lista-vacia))
```

Ejercicio

```
->cons(let x = 3 in x cons(3 empty))

*(struct:lista-cons 3 #(struct:lista-vacia)))
->cons(1 2)

*1 segundo argumento de cons no es una lista 2
